

ABSTRACT OF THE DISCLOSURE

The present invention relates to electronic equipment connected to a communication line for accessing an access point via the communication line to perform an information communication. An object of the present invention is to provide electronic equipment capable of suitably setting up the access point without needs of expensive equipment. According to the electronic equipment of the present invention, there are prepared a schedule file, which records an action schedule, and an access point file which records an association between an access point and information as to a place, and the present seat is detected from the schedule file, so that the access point according to the seat is set up.
